Abstract:

Keywords: Optimization• Convexity

Introduction

0.1. Definitions

0.2. Useful lemmas and Theorems.

Lemma 0.1.
Let $(x_n)_{n\in\mathbb{N}}$ be a bounded sequence in a Hilbert Space H. Then $(x_n)_{n\in\mathbb{N}}$ possesses a weakly convergent subsequence.

Lemma 0.2.
Let $(x_n)_{n\in\mathbb{N}}$ be a sequence in a Hilbert Space H. Then $(x_n)_{n\in\mathbb{N}}$ converges if and only if it is bounded and possesses at most one weak sequential cluster point.

Theorem 0.1.
Let $f : H \to (\infty, \infty]$ be a convex functional on a Hilbert space. Then the following are equivalent:

(i) f is weakly sequentially lower semicontinuous.

(ii) f is sequentially lower semicontinuous.

(iii) f is lower semicontinuous.

(iv) f is weakly lower semicontinuous.

Lemma 0.3.
A convex set is closed if and only if it is weakly closed.

Lemma 0.4.
Every bounded linear operator over a Banach Space is weakly continuos.

Lemma 0.5 (Parallelogram law).

$$\|x+y\|^2 + \|x-y\|^2 = 2\|x\|^2 + 2\|y\|^2$$

1. Lecture 1

Fact 1.1.
Let $x \in H$, let U be a neighborhood of x, let G be a real Banach space, let $T : U \to G$, let V be a neighborhood of Tx, and let $R : V \to K$. Suppose that T is Frchet differentiable at x and that R is Gteaux differentiable at Tx. Then $R \circ T$ is Gateâux differentiable at x and $\mathsf{D}(R \circ T)(x) = (\mathsf{D}R(Tx)) \circ \mathsf{D}T(x)$. If R is Fréchet differentiable at x, then so is $R \circ T$.

Fact 1.2.
Let $x \in H$, let U be a neighborhood of x, let K be a real Banach space, and let $T : U \to K$. Suppose that T is twice Fréchet differentiable at x. Then $\forall (y, z) \in H \times H$, $(\mathsf{D}^2 T(x)y)z = (\mathsf{D}^2 T(x)z)y$.

Definition 1.1.
Let $x \in H$, let $C \in \mathcal{V}(x)$, and let $T : C \to K$. Then T is Fréchet differentiable at x if there exists an operator $\mathbf{D}T(x) \in B(H, K)$, called the Frchet derivative of T at x, such that

$$\lim_{0 \neq \|y\| \to 0} \frac{\|T(x + y) - Tx - \mathsf{D}T(x)y\|}{\|y\|} = 0$$

2. Lecture 2

2.1. Convexity

Definition 2.1.
Let U be linear space. A functional $J : U \to \overline{\mathbb{R}}$ is called convex, if for $t \in [0, 1]$ and $u_1, u_2 \in U$.

$$J(tu_1 + (1 - t)u_2) \leq tJ(u_1) + (1 - t)J(u_2) \tag{1}$$

holds such that the right hand sid is well defined.

- J is strictly convex if (1) holds strictly for $\forall u_1, u_2 \in U$, $u_1 \neq u_2$ and $t \in (0, 1)$ with $J(u_1) < \infty$ and $J(u_2) < \infty$.
- An optimization problem,

  $$\min_{u \in C} J(u)$$

  is called convex if both C and J are convex.

Lemma 2.1.
If C and V are convex in U, then

- *$\alpha V = \{w = \alpha v, v \in C\}$ is convex.*
- *$C + V$ is convex.*

Proof. □

Lemma 2.2.
Let V be a collection of convex sets in U, then $C = \bigcap_{K \in V} K$ is convex.

Proof. If $C = \emptyset$, then C the statement is vacuously true. Consider $C \neq \emptyset$ and $u_1, u_2 \in C$ then $u_1, u_2 \in K$ for all $K \in V$

$$\implies tu_1 + (1 - t)u_2 \in K, \quad \forall K \in V \implies tu_1 + (1 - t)u_2 \in \bigcap_{K \in V} K$$

□

Lemma 2.3.

Let $C \in U$ convex and $J : C \to \mathbb{R}$. Define $\alpha = \inf_{u \in C} J(u)$. Then the set $\Psi = u | J(u) = \alpha$ is convex, i.e. the solution of

$$\min_{u \in C} J(u)$$

is a convex set.

Proof. Let $u_1, u_2 \in \Psi$ and $u_t = tu_1 + (1-t)u_2$.Sinc J is convex, it holds that $J(u_t) \leq tJ(u_t) + (1-t)J(u_t) = \alpha$. Thus $J(u_t) = \alpha$, $\forall t \in [0,1]$. Implying $u_t \in \Psi$ Hence Ψ is convex. □

Lemma 2.4.

Let U be linear normed space, and $C \subset U$ a convex set and $J : U \to \overline{\mathbb{R}}$ convex functional. Let $\overline{u} \in C$ such that

$$J(\overline{u}) \leq J(u) \quad \forall u \in B_\epsilon(\overline{u}) \cap C,$$

for some ball $B_\epsilon(\overline{u})$ in U with center in $\overline{u}$. Then $J(\overline{u}) = \inf_{u \in C} J(u)$. In other words, the local minimizer of a convex optimization problem is also a global minimizer.

Proof. Let $B_\epsilon(\overline{u})$ be an open neighborhood of $\overline{u}$ with $J(\overline{u}) \leq J(u)$ for all $u \in B_\epsilon(\overline{u}) \cap C$. Take an arbitrary $u^* \in C$ and consider $u_t = t\overline{u} + (1-t)u^*$. Since C is convex $u_t \in C$.
For some $t \in (0,1)$, $u_t \in B_\epsilon(\overline{u})$.
Thus,

$$J(\overline{u}) \leq J(u_t) \leq tJ(\overline{u}) + (1-t)J(u^*).$$

We have $\forall t \in [0,1]$ that $(1-t) \leq 0$, then

$$(1-t)J(\overline{u}) \leq (1-t)J(u^*) \qquad \forall u^* \in C$$

Therefore, $\overline{u}$ is a local minimizer for C. □

Theorem 2.1.

Let U is Banach Space, $C \subset U$ convex and $J : C \to \mathbb{R}$ Gateâux differentiable. Consider the minimization problem.

$$\min_{u \in C} J(u)$$

1. *Let $\overline{u}$ be a local solution. Then $J'(\overline{u}; u - \overline{u}) \geq 0$, $\forall u \in C$.*
2. *If J is convex on C, then $J'(\overline{u}; u - \overline{u}) \geq 0$, $\forall u \in C$ is necessary and sufficient for global optimality of $\overline{u}$*
3. *If J is strictly convex on C, then the minimization problem admits at most one solution.*
4. *If C is closed, and J is convex and continuous with*

$$\lim_{\substack{u \in C \\ \|u\| \to \infty}} J(u) = \infty.$$

Then a global solution $\overline{u} \in C$ exists.

Proof.

1. Let $\overline{u}$ be a local solution $J(\overline{u}) \leq J(u)$, $\forall u \in B_\epsilon(\overline{u}) \cap C$, let $t \in [0,1]$, $u_t = \overline{u} + t(u - \overline{u})$, then $u_t \in C$, since C is convex.

   For small $t > 0$,

$$0 \leq \frac{1}{t}\left[J(u_t) - J(u)\right] \leq \frac{1}{t}\left[J(\overline{u} + t(u - \overline{u})) - J(u)\right] \xrightarrow{t \downarrow 0} J'(\overline{u}; u - \overline{u})$$

2. Since J is convex we have for $u \in C$, $J(\overline{u} + t(u - \overline{u})) \leq J(\overline{u}) + t\,[J(u) - J(\overline{u})]$, for $t > 0$

$$\implies J(u) - J(\overline{u}) \geq \frac{1}{t}\,[J(\overline{u} + t(u - \overline{u})) - J(\overline{u})] \xrightarrow{t \downarrow 0} J'(\overline{u}; u - \overline{u}) \geq 0.$$

Therefore $\overline{u}$ is a global minimizer.

3. Assume, that there are two solution for the minimization problem, $\overline{u}, u^* \in C$, such that $\overline{u} \neq u^*$ and $J(\overline{u}) = J(u^*) = \inf_{u \in C} J(u)$. Since J is strictly convex $J(u_t) = J(t\overline{u} + (1-t)u^*) < tJ(\overline{u}) + (1-t)J(u^*) = \alpha$ for all $t \in [0,1]$. Contradicting our assumption that u^* and $\overline{u}$ are solutions.

4. $\alpha = \inf_{u \in C} J(u) \in \mathbb{R} \cup \{-\infty\}$, choose a minimizing sequence $(u_k)_k \subset C$ with $J(u_k) \xrightarrow{k \to \infty} \alpha$

$\implies (u_k)_k$ is bounded, because $J \to \infty$ as $\|u\| \to \infty$.

$\implies (u_k)_k$ contains a weakly convergent subsequence $u_{k_e} \xrightarrow[e \to \infty]{} \overline{u} \in C$. Since C is closed and convex.

$\implies J$ is weakly-lower semicontinuos because it is convex and continuos.

$\square$

3. Lecture 3

Now consider Hilbert space $(H, \langle \cdot, \cdot \rangle)$ with the norm defined as $\|\cdot\| = \sqrt{\langle \cdot, \cdot \rangle}$.

Let be $J : H \to \mathbb{R}$ a functional over a Hilbert space H, we define the set,

$$\underset{v \in C \subseteq H}{\arg\min}\, J(x) := \{x \mid x \in C \wedge \forall v \in C :\ J(x) \leq J(v)\}.$$

By Riesz-Fréchet representation formula, exists a unique vector $\nabla J(x) \in H$ such that,

$$(\forall y \in H) \quad J'(x; y) = \langle y, \nabla J(x) \rangle$$

namely Gateâux gradient of J at x.

Lemma 3.1.
Let H Hilbert space and $C \subset H$ closed and convex. Define $P_C : H \to C$,

$$P_C(x) = \underset{v \in C}{\arg\min}\, [\|v - x\|].$$

Then,

1. *P_C is well defined, i.e. $\exists! u \in C$ such that $P_C(x) = \{u\}$ $\forall x \in H$.*
2. *$\forall u, x \in H$, we have $u = P_C(x) \iff u \in C$ and $\langle x - u, v - u \rangle \leq 0$ $\forall v \in C$.*
3. *$\|P_C(u) - P_C(\overline{u})\| \leq \|u - \overline{u}\|$ $\ \forall u, \overline{u} \in H$, i.e. The projection P_C is non expansive.*
4. *$\langle P_C(u) - P_C(\overline{u}), u - \overline{u} \rangle \leq 0, \quad \forall u, \overline{u} \in H$*
5. *Let be $t > 0$ a real number, then $\forall u \in C$, and $\forall v \in H$, $\phi(t) = \frac{1}{t}\|P_C(u + tv) - u\|$ is non-increasing.*

Proof. 1. First we prove existence, let be $(v_k)_k$ a minimizing sequence in C, such that

$$\|x - v_k\| \to \alpha = \inf_{v \in C} \|x - v\|,$$

By the parallelogram law,

$$2\|v_j - x\|^2 + 2\|v_i - x\|^2 = \|v_j - v_i\|^2 + \|v_j + v_i - 2x\|^2$$
$$2\|v_j - x\|^2 + 2\|v_i - x\|^2 = \|v_j - v_i\|^2 + 4\left\|\frac{v_j + v_i}{2} - x\right\|^2$$
$$\implies 2\|v_j - x\|^2 + 2\|v_i - x\|^2 - 4\left\|\frac{v_j + v_i}{2} - x\right\|^2 = \|v_j - v_i\|^2$$

Since C is convex $\frac{v_i + v_j}{2} \in C$, then by definition of α,

$$0 \le \alpha \le \left\|\frac{v_j + v_i}{2} - x\right\|$$

Therefore the above equations become in the following inequality,

$$2\|v_j - x\|^2 + 2\|v_i - x\|^2 - 4\alpha^2 \ge \|v_j - v_i\|^2$$

Since $\|v_i - x\| \to \alpha$ and $\|v_j - x\| \to \alpha$, we have that $\|v_j - v_i\| \to 0$, therefore the series is Cauchy and then converges. Since C is closed the series converges to a point $v \in C$.

Second we prove uniqueness, we proceed by contradiction, take $v, v' \in C$ such $v \neq v'$, and both of them minimizing the distant with respect the point x, i.e.

$$\|x - v\| = \|x - v'\| = \alpha = \min_{u \in C} \|u - x\|$$

By the parallelogram law,

$$2\|x - v\|^2 + 2\|x - v'\|^2 = \|2x - v - v'\|^2 + \|v - v'\|^2$$

Since C is convex, $\left\|\frac{v + v'}{2} - x\right\| \ge \alpha$

$$\|v - v'\|^2 = 2\|x - v\|^2 + 2\|x - v'\|^2 - \|2x - v - v'\|^2$$
$$\|v - v'\|^2 = 2\|x - v\|^2 + 2\|x - v'\|^2 - 4\left\|x - \frac{v - v'}{2}\right\|^2$$
$$\|v - v'\|^2 = 2\alpha^2 + 2\alpha^2 - 4\left\|x - \frac{v - v'}{2}\right\|^2 \le 0$$

Therefore $\|v - v'\| = 0$, and $v = v'$.

By the uniqueness and existence $\arg\min_{u \in C} [\|u - x\|]$ is not empty set and has only one element for each $x \in H$.

Thus, P_C is well defined.

□

Theorem 3.1.
Let H be Hilbert space, $C \subset H$ closed and convex, $J : C \to \mathbb{R}$, Gateâux differentiable at the local solution $\overline{u}$ of $\min_{u \in C} J(u)$. Thus, $J'(\overline{u}; u - \overline{u}) \ge 0$, $\forall u \in C$ and it is equivalent to $\overline{u} = P_C(\overline{u} - \delta \nabla J(\overline{u}))$, $\forall \delta > 0$.

Proof. Since every Hilbert Space is a Banach space, and C is closed and Convex subset of H, and $\overline{u}$ is a solution of minimization problem; we can apply 2.1.
Thus $J'(\overline{u}; u-\overline{u}) \geq 0 \iff \langle u-\overline{u}, \nabla J(\overline{u})\rangle \geq 0 \; \forall u \in C$.
For all $\delta > 0$, we multiply the Gateâux gradient $(-\delta)$ and we have,

$$\langle u-\overline{u}, -\delta\nabla J(\overline{u})\rangle \leq 0 \; \forall u \in C,$$

adding zero to the gradient, $\langle u-\overline{u}, \overline{u}-\delta\nabla J(\overline{u})-\overline{u}\rangle \leq 0$. Then we set $w \in H$ as $w := \overline{u}-\delta\nabla J(\overline{u})$, and applying lemma 3.1 we have,

$$\overline{u} = P_C(w) \iff \langle u-\overline{u}, w-\overline{u}\rangle$$

Thus,

$$\overline{u} = P_C(\overline{u}-\delta J(\overline{u}))$$

□

3.1. Application

Consider U, Y, Z Hilbert spaces. Let be $J : Y \times U \to \mathbb{R}$ a functional. Consider the minimization problem,

$$\begin{cases} \overline{u} = \min\limits_{y,u} J(y,u) \\ Ay = Bu \quad u \in U_{ad} \subset U \end{cases}$$

For some set U_{ad} closed, convex and bounded. And $A \in \mathcal{L}(Y,Z)$ bounded and invertible with $A^{-1} \in \mathcal{L}(Z,Y)$ and $B \in \mathcal{L}(U,Z)$.

Then we can write $y \in Y$ as a function of $u \in U$,

$$y = y(u) = A^{-1}Bu$$

Consider the reduced cost functional $F(u) := J(y(u),u)$, then our problem is equivalent to

$$\overline{u}_{ad} = \min_{u \in U_{ad}} F(u)$$

Let $(u_k)_k \in U_{ad}$ denote a minimizing sequence, i.e. $F(u_k) \to \inf_{u \in U_{ad}} F(u)$, since $u_k \in U_{ad}$ the sequence is bounded. Therefore we can find a convergent subsequence $u_{k_l} \xrightharpoonup[l\to\infty]{} \overline{u}$, moreover since U_{ad} is closed and convex U_{ad} is weakly closed, implying $\overline{u} \in U_{ad}$

Proposition 3.1.
If J is continuous and weakly lower semicontinuous, then $\overline{u} = \arg\min\limits_{u \in U_{ad}} [F(u)]$.

Proof. If J is weakly lower semicontinuos

$$J(y(\overline{u}), \overline{u}) \leq \liminf_{l\to\infty} J(y(u_k), u_k)$$

That is,

$$F(\overline{u}) \leq \liminf_{l\to\infty} F(u_k) = \alpha$$

Since $u_{k_l} \xrightharpoonup[l\to\infty]{} \overline{u}, \implies y(u_k) \rightharpoonup y(\overline{u})$ and $A^{-1}Bu_k \rightharpoonup A^{-1}B\overline{u}$ □

J is Gateâux differentiable, applying the chain rule to F and valuating in u we have

$$F_u(u;h) = J_y(y;\alpha(u;h),u) + J_u(y,u;h)$$

$$\begin{aligned}
0 &\leq \langle u-\overline{u}, \nabla_u F(\overline{u})\rangle \quad \forall u \in U_{ad}\\
&= \langle A^{-1}B(u-\overline{u}), \nabla_y J(\overline{y},\overline{u})\rangle_{Y^*Y} + \langle u-\overline{u}, \nabla_u J(\overline{y},\overline{u})\rangle_{U^*U}\\
&= \langle A^{-1}B(u-\overline{u}), \nabla_y J(\overline{y},\overline{u})\rangle_{Y^*Y} + \langle u-\overline{u}, \nabla_u J(\overline{y},\overline{u})\rangle_{U^*U}\\
&= \langle u-\overline{u}, (A^{-1}B)^* \nabla_y J(y,\overline{u})\rangle_{U^*U} + \langle u-\overline{u}, \nabla_u J(y,\overline{u})\rangle_{U^*U}\\
&= \langle u-\overline{u}, (A^{-1}B)^* \nabla_y J(\overline{y},\overline{u}) + \nabla_u J(\overline{y},\overline{u})\rangle_{U^*U}
\end{aligned}$$

Setting $p^* = (A^{-1}B)^*\nabla_y J(\overline{y},\overline{u})$. We have that $\overline{u} = P_{U_{ad}}(\overline{u} - \delta(p^* + \nabla_u J(\overline{y},\overline{u})))$

4. Lecture 4

Lemma 4.1.
Let U be linear space and $J : U \to \overline{\mathbb{R}}$. Then

1. *If J is convex, then the effective domain $\mathrm{dom}(J) = \{u \in U|\ J(u) < \infty\}$ is convex.*
2. *J is convex $\iff$ $\mathrm{epi}(J) = \{(u,\alpha) \in U \times \mathbb{R} | J(u) \leq \alpha\}$ is convex.*

Proof. Since U and $\mathbb{R}$ are linear spaces, is easy to see that scalar multiplications and sums are well defined over $U \times \mathbb{R}$ and so over $\mathrm{epi}\,(J)$.

1. Assume J convex. If $u_1 \in \mathrm{dom}\,(J)$ and u_2 are elements of $\mathrm{dom}\,(J)$. Therefore, $J(u_1) < \infty$, and $J(u_2) < \infty$, therefore for $t \in [0,1]$, we have $tJ(u_1) < \infty$ and $(1-t)J(u_2) < \infty$. Since J is convex,

$$J(tu_1 + (1-t)u_2) \leq tJ(u_1) + (1-t)J(u_2) < \infty$$

,

Therefore, $tu_1 + (1-t)u_2 \in \mathrm{dom}\,(J)$. Hence $\mathrm{dom}\,J$ is convex.

2. First consider J a convex functional, then we have for all $u_1, u_2 \in U$,

$$J(tu_1 + (1-t)u_2) \leq tJ(u_1) + (1-t)J(u_2) \quad \forall t \in [0,1]$$

Let (u_1,α_1), (u_2,α_2) elements of $\mathrm{epi}\,(J)$, then $J(u_1) < \alpha_1$ and $J(u_2) < \alpha_2$. Since J is convex.

$$J(tu_1 + (1-t)u_2) \leq t\alpha_1 + (1-t)\alpha_2$$

Then $(tu_1 + (1-t)u_2, t\alpha_1 + (1-t)\alpha_2) \in \mathrm{epi}\,(J)$. Therefore, if J is convex, and (u_1,α_1), (u_2,α_2) are elements of $\mathrm{epi}\,(J)$ then,

$$t(u_1,\alpha_1) + (1-t)(u_2,\alpha_2) = (tu_1 + (1-t)u_2, t\alpha_1 + (1-t)\alpha_2) \in \mathrm{epi}\,(J)$$

Hence $\mathrm{epi}\,(J)$ is convex.

Now assume epi (J) convex. Let (u_1, α_1), (u_2, α_2) elements of epi (J) then $(tu_1 + (1-t)t\alpha_1 + (1-t)\alpha_2)$, then

$$J(tu_1 + (1-t)u_2) \leq t\alpha_1 + (1-t)\alpha_2 \quad \forall t \in [0,1]$$

By definition of epi (J), if $u_1, u_2 \in \operatorname{dom} J$, then $(u_1, J(u_1))$ and $(u_2, J(u_2))$, are elements of epi (J), therefore

$$J(tu_1 + (1-t)u_2) \leq tJ(u_1) + (1-t)J(u_2) \quad \forall t \in [0,1]$$

Implying that J is convex.

□

Definition 4.1.

Let U a Banach space. Then the function $J : U \to \overline{\mathbb{R}}$ is called lower semi-continuous at $u_0 \in U$ if the following conditions holds:

- If $\forall \epsilon > 0$ there is a neighborhood $B_\delta(u_0)$ of u_0 such that $J(u_0) - \epsilon \leq J(u)$ $\forall u \in B_\delta u_0)$.
- If $J(u_0) \leq \liminf_{n\to\infty} J(u_n)$ holds for each sequence $u_n \in U$.

Remark 4.1.

If the second condition holds, J is called sometimes sequentially semi-continuous. If J is continuous it is also lower semi-continuous.

Theorem 4.1.

Let U be a Banach space and $J : U \to \overline{\mathbb{R}}$. Then sthe following conditions are equivalent.

1. *J is lower semi-continuous, i.e., J is lower semi-continuous at every point in U.*
2. *The* epi (J) *is closed.*
3. *The level sets $\mu_\xi = \{u \in U | J(u) \leq \xi\}$ is a closed set. Note that the sets μ_ξ are closed if and only if the sets $\gamma_\xi = \{u \in U | J(u) > \xi\}$ are open. (Since $\mu_\xi^c = \gamma_\xi$).*

Proof.

- (1) $\implies$ (2) Let (u_n, ξ_n), be a sequence in epi (J), such that converges to (u, ξ) in $U \times \mathbb{R}$. Then

$$J(u) \leq \liminf_{n\to\infty} J(u_n) \leq \liminf_{n\to\infty} \xi_n = \xi.$$

  Hence $(u, \xi) \in$ epi (J).

- (2) $\implies$ (3)Let $\xi \in \mathbb{R}$ and assume that $(u_n)_{n\in\mathbb{N}}$ is a sequence in μ_ξ that converges to u. Then the set $(u_n, \xi)_{n\in\mathbb{N}}$ is in epi (J). Since epi (J) is closed, we conclude that $(u, \xi) \in$ epi (J), and hence $u \in \mu_k$.
- (3) $\implies$ (1) Let bet $u \in U$ an arbitrary member of the Banach space U, and let $(u_n)_{n\in\mathbb{N}}$ be a sequence that converges to u. And we set the number $\eta = \liminf_{n\to\infty} J(u_n)$. Then we have to prove that $J(u) \leq \eta$. When $\eta = \infty$, the inequality is clear. Therefore we assume that $\eta < +\infty$. Since every sequence in $\mathbb{R}$ has a subsequence that converges to the lim inf, the sequence $(u_n)_n$ has a subsequence $(u_k)_k$, such that $J(u_k) \xrightarrow{k\to\infty} \eta$. Now, we can fix $\xi \in (\eta, \infty)$. By convergence we can find c such that $k \geq c$ implies that $(J(u_k))$ belongs to $(-\infty, \xi)$, therefore the set

$$\{u_k | \ k \geq c \in \mathbb{N}\} \subset \mu_\xi.$$

  Since the sequence $u_n \to u$, the subsequence $u_k \to u$. And μ_ξ closed implies $u \in \mu_\xi$. Since this holds for all $\eta < \infty$, we take $\xi \downarrow \eta$. Implying $J(u) \leq \eta$.

□

Example 4.1.
The indicator function of a set $C \subset U$, i.e. the function $I_C : U \to [-\infty, \infty]$

$$I_C(u) = \begin{cases} 0, & \text{if } u \in C \\ +\infty, & otherwise, \end{cases}$$

is lower semi-continuous if and only if C is closed.

Proof. Take $\xi \in \mathbb{R}$. If $\xi < 0$, the set $\mu_\xi = \emptyset$. If $\xi > 0$, the set $\mu_\xi = C$. Therefore the sets m_ξ, for all $\xi \in \mathbb{R}$ is closed if and only if C is closed. By the theorem 4.1 I_C is lower semi-continuous if and only if C is closed. □

The Dual Systems of Linear Spaces

Two linear spaces X and Y over the same scalar field Γ define a dual system if a fixed bilinear functional on their product is given:

$$(\cdot, \cdot) : X \times Y \to \Gamma$$

.

The bilinear functional is sometimes omitted.

The dual system is called separated if the following two properties hold:

1. $\forall x \in X \backslash \{0\}$ there is $y \in Y$ such that $(x, y) \neq 0$.

2. $\forall y \in Y \backslash \{0\}$ there is $x \in X$ such that $(x, y) \neq 0$.

In other words, X separates points in Y and Y separates points in X. We consider only separated dual systems. For each $x \in X$, we define the application $f_x : Y \to \Gamma$ by

$$f_x(y) = (x, y) \quad \forall y \in Y$$

We observe that f_x is a linear functional on Y and the mapping $x \to f_x, \quad \forall x \in X$, is linear and injective, as can be seen from condition (1). Hence, the correspondence is an embedding. Thus, the elements of X can be identified with the linear functionals on Y. In a similar way, the elements of Y can be considered as linear functionals of X, identifying an element $y \in Y$ with $g_y : X \to \Gamma$, defined by

$$g_y(x) = (x, y), \quad \forall x \in X.$$

Therefore, each dual system of linear spaces defines a mapping from either of the two linear spaces into the space of linear functionals on the other. We set,

$$p_y(x) = |(x, y)| = |g_y(x)|, \quad \forall x \in X$$

$$q_x(y) = |(x, y)| = |f_x(y)|, \quad \forall y \in Y$$

and we observe that $\mathcal{P} = \{p_y |\ y \in Y\}$ is a family of seminorms on X and $\mathcal{Q} = \{q_x |\ y \in X\}$ is a family of seminorms on Y.

Definition 4.2.
If U is a normed space, the the dual space $U^* = \mathcal{B}(U, \mathbb{R})$. Consists of all linear and bonded functionals mapping from U to $\mathbb{R}$.

Theorem 4.2.
Let be U a Banach space, then the dual U^* is also a Banach space relative to the norm of the functionals defined by

$$\|u^*\| = \sup_{\|u\| \leq 1} |u^*(u)|$$

Remark 4.2.
There is a natural duality between U and U^* determined by the bilinear functional $(\cdot, \cdot) : U \times U^* \to \mathbb{R}$, defined as

$$(u, u^*) = u^*(u), \quad \forall u \in U, \forall u^* \in U^*$$

Example 4.2.
The dual of the L^p can be identified with L^q, where $\frac{1}{p} + \frac{1}{q} = 1$.

Definition 4.3.
A sequence $(u_n)_n$ in a Banach space is called weakly convergent to some $u \in U$ if for all linears continuous functionals $u^* \in U^*$ we have

$$\lim_{n \to \infty} u^*(u_n) = u^*(u)$$

u is also called the weak-limit and we write $u_n \xrightharpoonup[n \to \infty]{} u$.

Theorem 4.3.
A sequence $(u_n)_n$ in U converges to $u \in U$ if and only if $\sup_{n \in \mathbb{N}} \|u_n\|$

7. Lecture 7

Remark 7.1.
Some elementary properties of conjugate functions

- **Young inequality** $J(u) + J^*(p^*) \geq p^*(u) \quad \forall u \in U, \forall p^* \in U^*$
- $J^*(0) = \sup_{u \in U} ((0, u) - J(u)) = \sup_{u \in U} (-J(u)) = \inf_{u \in U} J(u)$

In many applications in optimization, is used the equivalent formulation,

$$\inf_{u \in U} J(u) = -J^*(0).$$

$J \leq F \implies J^* \geq F^*$

Theorem 7.1.
Let U a Banach space and $J^*: U^* \to \overline{\mathbb{R}}$ be the conjugate of the $J: U \to \overline{\mathbb{R}}$. Then for all $u \in U$.

$$p^* \in \partial J(u) \iff J(u) + J^*(p^*) = p^*(u)$$

.

Proof. content... □

Corollary 7.1.
It follows from previous theorem that $\partial J(u) = \{p^* \in U^* | J(u) + J^*(p^*) = (p^*, u)\}$.

Theorem 7.2.
Let U be a Banach space and $J: U \to \mathbb{R}$ be proper function. If $p^* \in \partial J(u)$ then $u \in \partial J^*(p^*)$

Proof. Let $p^* \in \partial J(u)$. For any $g^* \in U^*$, it follows

$$J^*(g^*) = \sup_{v \in U} (g^*(v) - J(v)) \geq g^*(u) - J(u) \geq g^*(u) - J(u)$$

From theorem 7.1

$$J^*(g^*) \leq g^*(u) - p^*(u) + J^*(p^*) = (g^* - p^*)(u) + J^*(p^*) \implies u \in \partial J^*(p^*).$$

□

By iteration the definition, we obtain the bipolar function $(J^*)^* = J^{**}: U^{**} \to \overline{\mathbb{R}}$,

$$J^{**}(u) = \sup_{p^* \in U^*} \{p^*(u) - J^*(p^*)\}$$

Theorem 7.3.
Let U be a reflexive Banach space. The J^{**} is the maximum convex functional below J (also called convex envelope), i.e. $J^{**}(u) \leq J(u)$, $\forall u \in U$ and $F(u) \leq J^{**}(u)$, $\forall u \in U$ if F is also convex and $F(u) \leq J(u)$, $\forall u$. In particular $J^{**} = J$ if and only if J is convex.

Proof.

$$J^{**}(u) = \sup_{p^* \in U^*} \{p^*(u) - J^*(p^*)\} \tag{2}$$

$$= \sup_{p^* \in U^*} \left\{p^*(u) - \sup_{v \in U} \{p^*(v) - J(v)\}\right\} \tag{3}$$

$$= \sup_{p^* \in U^*} \left\{p^*(u) + \inf_{v \in U} \{p^*(v) - J(v)\}\right\} \tag{4}$$

$$\tag{5}$$

Since for any $p^* \in U^*$,

$$\inf_{v \in U} \{p^*(u - v) + J(v)\} \leq p^*(u - u) + J(u)$$

We have that $J^{**}(u) \leq J(u)$.

Now we assume that F is a convex functional and $g^* \in \partial F(u)$ for $u \in U$.

$$\begin{aligned}
\implies F(v) &\geq F(v) + q^*(v-u) && (6)\\
F^{**}(u) &= \sup_{p^* \in U^*} \inf_{v \in U} \{p^*(u-v) + F(u) + q^*(v-u)\} && (7)\\
&\geq \sup_{p^* \in U^*} \inf_{v \in U} \{(p^* - q^*)(u-v) + F(u)\} && (8)\\
&\geq \inf_{v \in U} \{(q^* - q^*)(u-v) + F(u)\} && (9)\\
&= F(u) && (10)
\end{aligned}$$

If F is convex,

$$\implies F(u) \leq F^{**}(u) \leq F(u) \implies F(u) = F^{**}(u), \tag{11}$$

$$F(u) = F^{**}(u) = \sup_{p^* \in U^*} \inf_{v \in U} \{p^*(u-v) + F(v)\} \leq J**(u) \tag{12}$$

□

8. Lecture 8

Definition 8.1.
Let U and Y Banach spaces and $J : U \to \overline{\mathbb{R}}$ is a proper function. We consider an optimization problem (P) called primal problem

$$\inf_{u \in U} J(u) \tag{P}$$

Then the problem is said to be nontrivial if there is $\overline{u} \in U$ such that $J(\overline{u}) < \infty$. A function $\Phi : U \times Y \to \overline{\mathbb{R}}$ is said to be a perturbation function of J,

$$\inf_{u \in U} \Phi(u, p) \tag{Pp}$$

if $\Phi(u, 0) = J(u)$ for all $u \in U$. For each $p \in Y$, the minimization problem (Pp) is called a perturbation problem. The variable p is called perturbation parameter. If we denote by Φ^* the convex conjugate function of Φ, the *dual problem*, with respect to Φ is defined by

$$\sup_{p^* \in Y^*} -\Phi^*(0, p^*) \tag{P*}$$

where $\Phi^* : (U \times Y)^* \cong U^* \times Y^* \to \overline{\mathbb{R}}$, a function defined as follows.

$$\Phi^*(u^*, p^*) = \sup_{\substack{u \in U\\ p \in Y}} \left((u^*, u)_{U^*U} + (p^*, p)_{Y^*Y} - \Phi(u, p)\right)$$

Remark 8.1.
For $p = 0$, (P*) $\equiv$ (Pp). We denote the infimum for problem (P) by inf (P) and the supremum for problem (P*) by sup (P*)

Lemma 8.1 (Weak duality).
For the problem (P) *and* (P*) *it holds that*

$$-\infty \leq \sup(\text{P*}) \leq \inf(\text{P}) \leq \infty.$$

Proof. Let $p^* \in Y^*$. It follows

$$
\begin{aligned}
-\Phi^*(0,p^*) &= -\sup_{\substack{u\in U\\ p\in Y}} \left((0,u)+(p^*,p)-\Phi(u,p)\right) && (13)\\
&= \inf_{\substack{u\in U\\ p\in Y}} \left(\Phi(u,p)-(p^*,p)\right) && (14)\\
&\leq \left(\Phi(u,0)-(p^*,0)\right) \quad \forall u\in U, p^*\in Y^* && (15)\\
\implies \sup_{p^*\in Y^*}\left(-\Phi\left(0,p^*\right)\right) &\leq \inf_{u\in U}\Phi(u,0)=\inf(P) && (16)
\end{aligned}
$$

□

By iteration we can define, a bidual problem

$$
-\sup_{u\in U}\left(-\Phi^*(u,0)\right)=\inf_{u\in U}\Phi^*(u,0) \tag{P**}
$$

In case the space U is reflexive then $U^{**}=U$.

If the perturbation function $\Phi(u,p)$ is proper, convex and weakly lower semicontinuous. Then $\Phi^{**}=\Phi$. In this case $\Phi(u,0)=\Phi^{**}(u,0)$ i.e (P)≡ (P**)

Definition 8.2.

Consider the infimal value function

$$
h(p^*)=\inf\left(\text{Pp}\right)=\inf_{u\in U}\Phi(u,p)
$$

The problem (P) is called stable if $h(0)$ is finite and its sub-differentiable in zero is not empty.

Theorem 8.1.

The primal problem (P) is stable if and only if the following conditions are simultaneously satisfied:

- *The dual problem (P*) has a solution.*
- *There is no duality gap, i.e.*

$$
\inf\left(\text{P}\right)=\sup\left(\text{P*}\right)\leq\infty
$$

Theorem 8.2 (Extremal relation).

Let $\Phi: U\times Y\to\overline{\mathbb{R}}$, be convex the the following statements are equivalent:

1. *(P) and (Pp) have solutions $\overline{u}$ and $\overline{p^*}$ and* $\inf(P)=\sup(P^*)$
2. $\Phi(\overline{u},0)+\Phi^*\left(0,\overline{p^*}\right)=0$
3. $\left(0,\overline{p^*}\right)\in\partial\Phi(u,0)$ *and* $(\overline{u},0)\in\partial\Phi^*(0,p^*)$

Proof. We proceed by parts:

1. (1) $\implies$ (2): $\overline{u}$ solution of $\inf\left(\text{P}\right)$ and $\overline{p^*}$ solution of $\sup\left(\text{P*}\right)$ and $\inf\left(\text{P}\right)=\sup\left(\text{P*}\right)$. This properties implies, $\Phi(\overline{u},0)=\inf\left(\text{P}\right)=\sup\left(\text{P*}\right)=-\Phi(0,\overline{p^*}) \implies \Phi(\overline{u},0)+\Phi^*(0,\overline{p^*})=0$.
2. (2) $\implies$ (1): $-\Phi^*(0,\overline{p^*})=\sup\left(\text{P*}\right)\leq\inf\left(\text{P}\right)=\Phi(\overline{u},0)=-\Phi^*(0,\overline{p^*}) \implies \sup\left(\text{P*}\right)=\inf\left(\text{P}\right)$
3. (2) $\iff$ (3): $\Phi(\overline{u},0)+\Phi^*(0,\overline{p^*})=0=(0,\overline{u})+(\overline{p^*},0)=\left((0,\overline{p^*}),(\overline{u},0)\right) \iff (0,\overline{p^*})\in\partial\Phi(\overline{u},0)\ \forall u\in U,\forall p^*\in\partial J(u) \iff J(u)+J^*(p^*)=(p^*,u)$

□

Fencel duality.

Consider the functional $J : U \to \overline{\mathbb{R}}$,

$$J(u) = F(u) + G(Au)$$

with $F : U \to \overline{\mathbb{R}}$, G convex function $G : V \to \overline{\mathbb{R}}$ and $A : U \to V$ bounded and linear.

We introduce the perturbation $\Phi(u, p) = F(u) + G(Au - p)$. The dual problem is obtained with,

$$\Phi^*(0, p^*) = \sup_{\substack{u \in U \\ p \in V}} ((p^*, p) - F(u) - G(Au - p))$$

For fixed u we set $q : Au - p$.

$$\begin{aligned}
\Phi^*(0, p^*) &= \sup_{u \in U} \sup_{p \in V} ((p^*, Au - q) - F(u) - G(q)) \\
&= \sup_{u \in U} \sup_{p \in V} ((A^* p^*, u) - (p^*, q) - F(u) - G(q)) \\
&= \sup_{u \in U} ((p^*, Au) - F(u)) + \sup_{p \in V} ((-p^*, q) - G(q)) \\
&= F^*(A^* p^*) + G^*(-p^*)
\end{aligned}$$
